Title
Evaluation of efficacy and safety of feline interleukin-2 immunomodulator following surgical excision of feline fibrosarcoma

Purpose
Feline sarcoma is an aggressive tumor that has a high rate of return, despite surgical removal of this cancer.

In this study researchers will test whether a feline interleukin-2 immunomodulator injections (intended to stimulate the immune system) will decrease the rate of cancer recurrence compared to the current standard of care which is surgical removal by itself.

Eligibility
To be eligible for this study, cats must meet several criteria, including but not limited to the following:

- Clinically confirmed diagnosis of feline fibrosarcoma (TNM stage T1N0M0) less than 5cm in diameter that is amenable to surgical resection.
- Tumor cannot be present on the head, tail, or distal limbs.
- Must be FeLV, FIV negative
